## Natural Resource Savings through DRF's Resource Conservation Solutions Program

Location: River Forest, IL  
Facility Size: 30 acres

RESOURCE  
CONSERVATION  
SOLUTIONS

### PROJECT DESCRIPTION

**Multi-phase project over two years to eliminate non-essential potable water use.**

### PROJECT OVERVIEW

**Project Cost:** \$123,225

**Payback Period:** < 1 year

**Annual Potable Water Savings:** 4-6 million gallons

### THE TEAM

**Dan Bulow** • Director of Buildings and Grounds, DU

**Dennis Fiddick** • Solutions Engineer, DRF

**Scott Schnurr** • President, DRF

### THE NEED

The original goal was to get a well on campus that would eliminate the use and purchase of domestic water for irrigation of grass areas and a soccer field. Further research exposed the need for cooling tower makeup water as well, and the difficult task of bringing in a well large enough for the job.

### THE SOLUTION

A campus walk brought the team to an 80,000 gallon cistern which was ultimately reclaimed for capture of rain & ground water. A water level control system was installed in the cistern to achieve automatic well operation. A new pressure controlled pump station, replenishment well and supply lines completed the new highly efficient irrigation system, eliminating potable water use for irrigation and cooling tower makeup water.

### THE RESULT

*"The project has worked very well. All design factors have been effective,"* explains Dan Bulow. Dominican University is no longer using potable water for irrigation, providing monumental resource conservation. They look forward to putting the financial savings towards new green initiatives.
